Outline

Introduction 1

Quantum entanglement

- Most surprising feature of quantum mechanics,
  No analog in classical mechanics

Introduction 1

Quantum entanglement

- Most surprising feature of quantum mechanics,
  No analog in classical mechanics
- From pure state of the full system S: $\rho = |\psi\rangle\langle\psi|$, reduced density matrix of a subsystem A: $\rho_A = \mathrm{Tr}_{S-A}\,\rho$ can become mixed states, and has nonzero entanglement entropy

$$S_A = -\mathrm{Tr}_A\left[\rho_A \ln \rho_A\right].$$

This is purely a quantum property.

Introduction 2

Area law of entanglement entropy

- Ground states of quantum many-body systems with local interactions typically exhibit the area law behavior of the entanglement entropy: $S_A \propto (\text{area of } A)$
- Gapped systems in 1D are proven to obey the area law. [Hastings 2007]

Introduction 2

Area law of entanglement entropy

- Ground states of quantum many-body systems with local interactions typically exhibit the area law behavior of the entanglement entropy: $S_A \propto (\text{area of } A)$
- Gapped systems in 1D are proven to obey the area law.
  [Hastings 2007] (Area law violation) $\Rightarrow$ Gapless
- For gapless case, $(1+1)$-dimensional CFT violates logarithmically: $S_A = \frac{c}{3} \ln(\text{volume of } A)$. [Calabrese, Cardy 2009]

Introduction 2

Area law of entanglement entropy

- Ground states of quantum many-body systems with local interactions typically exhibit the area law behavior of the entanglement entropy: $S_A \propto$ (area of A)
- Gapped systems in 1D are proven to obey the area law. [Hastings 2007] (Area law violation) $\Rightarrow$ Gapless
- For gapless case, $(1+1)$-dimensional CFT violates logarithmically: $S_A = \frac{c}{3} \ln$ (volume of A). [Calabrese, Cardy 2009]
- Belief for gapless case in D-dim. (over two decades) : $S_A = O(L^{D-1} \ln L)$ (L: length scale of A)

Introduction 2

Area law of entanglement entropy

- Ground states of quantum many-body systems with local interactions typically exhibit the area law behavior of the entanglement entropy: $S_A \propto (\text{area of } A)$
- Gapped systems in 1D are proven to obey the area law. [Hastings 2007] (Area law violation) $\Rightarrow$ Gapless
- For gapless case, $(1+1)$-dimensional CFT violates logarithmically: $S_A = \frac{c}{3} \ln (\text{volume of } A)$. [Calabrese, Cardy 2009]
- Belief for gapless case in D-dim. (over two decades) : $S_A = O(L^{D-1} \ln L)$ (L: length scale of A)
- Recently, 1D solvable spin chain model which exhibit extensive entanglement entropy have been discussed.
  - Beyond logarithmic violation: $S_A \propto \sqrt{(\text{volume of } A)}$
    [Movassagh, Shor 2014], [Salberger, Korepin 2016]
    Counterexamples of the belief!

Motzkin spin model 1

[Bravyi et al 2012]

- 1D spin chain at sites $i \in \{1, 2, \cdots, 2n\}$
- Spin-1 state at each site can be regarded as up, down and flat steps;

$$|u\rangle \Leftrightarrow \nearrow, \qquad |d\rangle \Leftrightarrow \searrow, \qquad |0\rangle \Leftrightarrow \longrightarrow$$

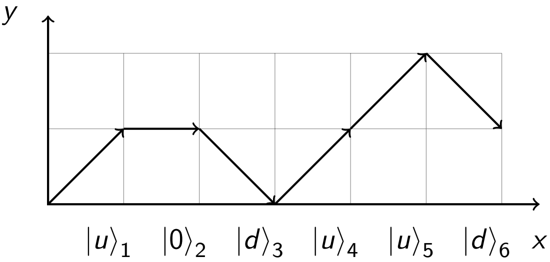
Motzkin spin model 1

[Bravyi et al 2012]

- 1D spin chain at sites $i \in \{1, 2, \cdots, 2n\}$
- Spin-1 state at each site can be regarded as up, down and flat steps;

$$|u\rangle \Leftrightarrow \nearrow, \qquad |d\rangle \Leftrightarrow \searrow, \qquad |0\rangle \Leftrightarrow \longrightarrow$$

- Each spin configuration $\Leftrightarrow$ length-$2n$ walk in (x, y) plane
  Example)



Motzkin spin model 2

[Bravyi et al 2012]

Hamiltonian: $H_{Motzkin} = H_{bulk} + H_{bdy}$

- Bulk part: $H_{bulk} = \sum_{j=1}^{2n-1} \Pi_{j,j+1}$,

$$\Pi_{j,j+1} = |D\rangle_{j,j+1}\langle D| + |U\rangle_{j,j+1}\langle U| + |F\rangle_{j,j+1}\langle F|$$

(local interactions) with

$$|D\rangle \equiv \frac{1}{\sqrt{2}}\left(|0,\, d\rangle - |d,\, 0\rangle\right),$$

$$|U\rangle \equiv \frac{1}{\sqrt{2}}\left(|0,\, u\rangle - |u,\, 0\rangle\right),$$

$$|F\rangle \equiv \frac{1}{\sqrt{2}}\left(|0,\, 0\rangle - |u,\, d\rangle\right).$$

Motzkin spin model 2

[Bravyi et al 2012]

Hamiltonian: $H_{Motzkin} = H_{bulk} + H_{bdy}$

- Bulk part: $H_{bulk} = \sum_{j=1}^{2n-1} \Pi_{j,j+1}$,

$$\Pi_{j,j+1} = |D\rangle_{j,j+1}\langle D| + |U\rangle_{j,j+1}\langle U| + |F\rangle_{j,j+1}\langle F|$$

(local interactions) with

$$|D\rangle \equiv \frac{1}{\sqrt{2}}\left(|0,\, d\rangle - |d,\, 0\rangle\right),$$

$$|U\rangle \equiv \frac{1}{\sqrt{2}}\left(|0,\, u\rangle - |u,\, 0\rangle\right),$$

$$|F\rangle \equiv \frac{1}{\sqrt{2}}\left(|0,\, 0\rangle - |u,\, d\rangle\right).$$

Motzkin spin model 2

[Bravyi et al 2012]

Hamiltonian: $H_{Motzkin} = H_{bulk} + H_{bdy}$

- Bulk part: $H_{bulk} = \sum_{j=1}^{2n-1} \Pi_{j,j+1}$,

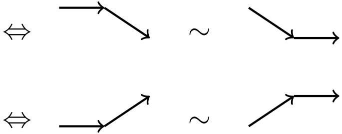
$$\Pi_{j,j+1} = |D\rangle_{j,j+1}\langle D| + |U\rangle_{j,j+1}\langle U| + |F\rangle_{j,j+1}\langle F|$$

(local interactions) with

$$|D\rangle \equiv \frac{1}{\sqrt{2}}\left(|0,\, d\rangle - |d,\, 0\rangle\right),$$

$$|U\rangle \equiv \frac{1}{\sqrt{2}}\left(|0,\, u\rangle - |u,\, 0\rangle\right),$$

$$|F\rangle \equiv \frac{1}{\sqrt{2}}\left(|0,\, 0\rangle - |u,\, d\rangle\right).$$



Motzkin spin model 2

[Bravyi et al 2012]

Hamiltonian: $H_{Motzkin} = H_{bulk} + H_{bdy}$

- Bulk part: $H_{bulk} = \sum_{j=1}^{2n-1} \Pi_{j,j+1}$,

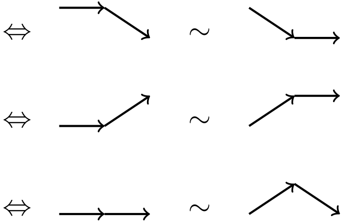
$$\Pi_{j,j+1} = |D\rangle_{j,j+1}\langle D| + |U\rangle_{j,j+1}\langle U| + |F\rangle_{j,j+1}\langle F|$$

(local interactions) with

$$|D\rangle \equiv \frac{1}{\sqrt{2}}\left(|0,\, d\rangle - |d,\, 0\rangle\right),$$

$$|U\rangle \equiv \frac{1}{\sqrt{2}}\left(|0,\, u\rangle - |u,\, 0\rangle\right),$$

$$|F\rangle \equiv \frac{1}{\sqrt{2}}\left(|0,\, 0\rangle - |u,\, d\rangle\right).$$



"gauge equivalence".

Motzkin spin model 3

[Bravyi et al 2012]

Hamiltonian: $H_{Motzkin} = H_{bulk} + H_{bdy}$

- Boundary part: $H_{bdy} = |d\rangle_1\langle d| + |u\rangle_{2n}\langle u|$

$$\Downarrow$$

Motzkin spin model 3

[Bravyi et al 2012]

Hamiltonian: $H_{Motzkin} = H_{bulk} + H_{bdy}$

- Boundary part: $H_{bdy} = |d\rangle_1\langle d| + |u\rangle_{2n}\langle u|$

$$\Downarrow$$

- $H_{Motzkin}$ is the sum of projection operators.

  $\Rightarrow$ Positive semi-definite spectrum

- We find the unique zero-energy ground state.

Motzkin spin model 3

[Bravyi et al 2012]

Hamiltonian: $H_{Motzkin} = H_{bulk} + H_{bdy}$

- Boundary part: $H_{bdy} = |d\rangle_1\langle d| + |u\rangle_{2n}\langle u|$

$$\Downarrow$$

- $H_{Motzkin}$ is the sum of projection operators.

  $\Rightarrow$ Positive semi-definite spectrum
- We find the unique zero-energy ground state.
  - Each projector in $H_{Motzkin}$ annihilates the zero-energy state.

    $\Rightarrow$ Frustration free
- The ground state corresponds to randoms walks starting at $(0, 0)$ and ending at $(2n, 0)$ restricted to the region $y \geq 0$ (Motzkin Walks (MWs)).

Motzkin spin model 4

[Bravyi et al 2012]

In terms of $S=1$ spin matrices

$$S_z = \begin{pmatrix} 1 & & \\ & 0 & \\ & & -1 \end{pmatrix}, \quad S_\pm \equiv \frac{1}{\sqrt{2}}(S_x \pm i S_y) = \begin{pmatrix} & 1 & \\ & & 1 \\ & & \end{pmatrix}, \begin{pmatrix} & & \\ 1 & & \\ & 1 & \end{pmatrix},$$

$$H_{bulk} = \frac{1}{2}\sum_{j=1}^{2n-1}\Big[1_j 1_{j+1} - \frac{1}{4}S_{z\,j}S_{z\,j+1} - \frac{1}{4}S_{z\,j}^2 S_{z\,j+1} + \frac{1}{4}S_{z\,j}S_{z\,j+1}^2$$
$$-\frac{3}{4}S_{z\,j}^2 S_{z\,j+1}^2 + S_{+\,j}\left(S_z S_-\right)_{j+1} + S_{-\,j}\left(S_+ S_z\right)_{j+1} - \left(S_- S_z\right)_j S_{+\,j+1}$$
$$-\left(S_z S_+\right)_j S_{-\,j+1} - \left(S_- S_z\right)_j \left(S_+ S_z\right)_{j+1} - \left(S_z S_+\right)_j \left(S_z S_-\right)_{j+1}\Big],$$
$$H_{bdy} = \frac{1}{2}\left(S_z^2 - S_z\right)_1 + \frac{1}{2}\left(S_z^2 + S_z\right)_{2n}$$

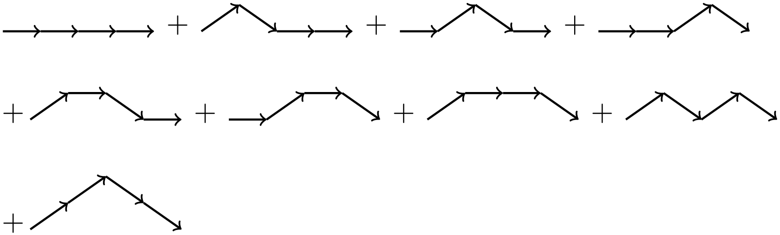
Quartic spin interactions

Motzkin spin model 5

[Bravyi et al 2012]

Example) $2n = 4$ case,

MWs:



$\Updownarrow$

Ground state:

$$
\begin{aligned}
|P_4\rangle \;=\; \frac{1}{\sqrt{9}} \big[& |0000\rangle + |ud00\rangle + |0ud0\rangle + |00ud\rangle \\
& + |u0d0\rangle + |0u0d\rangle + |u00d\rangle + |udud\rangle \\
& + |uudd\rangle \big] .
\end{aligned}
$$

Motzkin spin model 6

[Bravyi et al 2012]

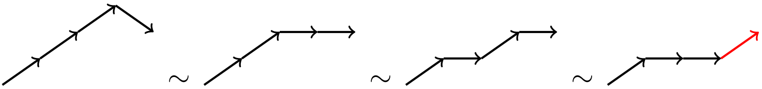
Note

Forbidden paths for the ground state

1. Path entering $y < 0$ region

Forbidden by H_{bdy}

2. Path ending at nonzero height



Forbidden by H_{bdy}

Motzkin spin model 7

[Bravyi et al 2012]

Entanglement entropy of the subsystem $A = \{1, 2, \cdots, n\}$:

- Normalization factor of the ground state $|P_{2n}\rangle$ is given by the number of MWs of length $2n$: $M_{2n} = \sum_{k=0}^{n} C_k \binom{2n}{2k}$.

  $C_k = \frac{1}{k+1}\binom{2k}{k}$: Catalan number

Motzkin spin model 7

[Bravyi et al 2012]

Entanglement entropy of the subsystem $A = \{1, 2, \cdots, n\}$:

- Normalization factor of the ground state $|P_{2n}\rangle$ is given by the number of MWs of length $2n$: $M_{2n} = \sum_{k=0}^{n} C_k \binom{2n}{2k}$.

  $C_k = \frac{1}{k+1}\binom{2k}{k}$: Catalan number

- Consider to trace out the density matrix $\rho = |P_{2n}\rangle\langle P_{2n}|$ w.r.t. the subsystem $B = \{n+1, \cdots, 2n\}$.
  Schmidt decomposition:

$$|P_{2n}\rangle = \sum_{h\geq 0} \sqrt{p_{n,n}^{(h)}} \left| P_n^{(0\to h)} \right\rangle \otimes \left| P_n^{(h\to 0)} \right\rangle$$

with $p_{n,n}^{(h)} \equiv \frac{\left(M_n^{(h)}\right)^2}{M_{2n}}$.

↑ Paths from $(0, 0)$ to (n, h)

Motzkin spin model 8

[Bravyi et al 2012]

- $M_n^{(h)}$ is the number of paths in $P_n^{(0\to h)}$.
  For $n \to \infty$, Gaussian distribution

$$p_{n,n}^{(h)} \sim \frac{3\sqrt{6}}{\sqrt{\pi}} \frac{(h+1)^2}{n^{3/2}} e^{-\frac{3}{2}\frac{(h+1)^2}{n}} \times [1 + O(1/n)] \,.$$

- Reduced density matrix

$$\rho_A = \mathrm{Tr}_B \rho = \sum_{h \geq 0} p_{n,n}^{(h)} \left| P_n^{(0\to h)} \right\rangle \left\langle P_n^{(0\to h)} \right|$$

- Entanglement entropy

$$\begin{aligned} S_A &= -\sum_{h\geq 0} p_{n,n}^{(h)} \ln p_{n,n}^{(h)} \\ &= \frac{1}{2}\ln n + \frac{1}{2}\ln\frac{2\pi}{3} + \gamma - \frac{1}{2} \qquad (\gamma\text{: Euler constant}) \end{aligned}$$

up to terms vanishing as $n \to \infty$.

Motzkin spin model 9

[Bravyi et al 2012]

Notes

- The system is critical (gapless).
  S_A is similar to the $(1+1)$-dimensional CFT with $c = 3/2$.

Motzkin spin model 9

[Bravyi et al 2012]

Notes

- The system is critical (gapless).
  S_A is similar to the $(1+1)$-dimensional CFT with $c = 3/2$.
- But, gap scales as $O(1/n^z)$ with $z \geq 2$.
  The system cannot be described by relativistic CFT.
  Lifshitz type ?
  Different z depending on excited states (Multiple dynamics)?
  [Chen, Fradkin, Witczak-Krempa 2017]

  [Chen, Fradkin, Witczak-Krempa 2017]
- Excitations have not been much investigated.

Colored Motzkin spin model 1

[Movassagh, Shor 2014]

- Introducing color d.o.f. $k = 1, 2, \cdots, s$ to up and down spins as

$$\left|u^k\right\rangle \Leftrightarrow \overset{k}{\nearrow}, \qquad \left|d^k\right\rangle \Leftrightarrow \overset{k}{\searrow}, \qquad |0\rangle \Leftrightarrow \longrightarrow$$

Color d.o.f. decorated to Motzkin Walks

Colored Motzkin spin model 1

[Movassagh, Shor 2014]

- Introducing color d.o.f. $k = 1, 2, \cdots, s$ to up and down spins as

$$\left|u^k\right\rangle \Leftrightarrow \overset{k}{\nearrow}, \qquad \left|d^k\right\rangle \Leftrightarrow \overset{k}{\searrow}, \qquad |0\rangle \Leftrightarrow \longrightarrow$$

Color d.o.f. decorated to Motzkin Walks

- Hamiltonian $H_{cMotzkin} = H_{bulk} + H_{bdy}$
    - Bulk part consisting of local interactions:

$$H_{bulk} = \sum_{j=1}^{2n-1} \left(\Pi_{j,j+1} + \Pi_{j,j+1}^{cross}\right),$$

$$\Pi_{j,j+1} = \sum_{k=1}^{s} \left[\left|D^k\right\rangle_{j,j+1}\left\langle D^k\right| + \left|U^k\right\rangle_{j,j+1}\left\langle U^k\right| + \left|F^k\right\rangle_{j,j+1}\left\langle F^k\right|\right]$$

with

Colored Motzkin spin model 2

[Movassagh, Shor 2014]

$$\left|D^k\right\rangle \equiv \frac{1}{\sqrt{2}}\left(\left|0,\, d^k\right\rangle - \left|d^k,\, 0\right\rangle\right),$$
$$\left|U^k\right\rangle \equiv \frac{1}{\sqrt{2}}\left(\left|0,\, u^k\right\rangle - \left|u^k,\, 0\right\rangle\right),$$
$$\left|F^k\right\rangle \equiv \frac{1}{\sqrt{2}}\left(|0,\, 0\rangle - \left|u^k,\, d^k\right\rangle\right),$$

and

$$\Pi^{cross}_{j,j+1} = \sum_{k \neq k'} \left|u^k,\, d^{k'}\right\rangle_{j,j+1}\left\langle u^k,\, d^{k'}\right|.$$

$\Rightarrow$ Colors should be matched in up and down pairs.

- Boundary part

$$H_{bdy} = \sum_{k=1}^{s}\left(\left|d^k\right\rangle_1\left\langle d^k\right| + \left|u^k\right\rangle_{2n}\left\langle u^k\right|\right).$$

Colored Motzkin spin model 3

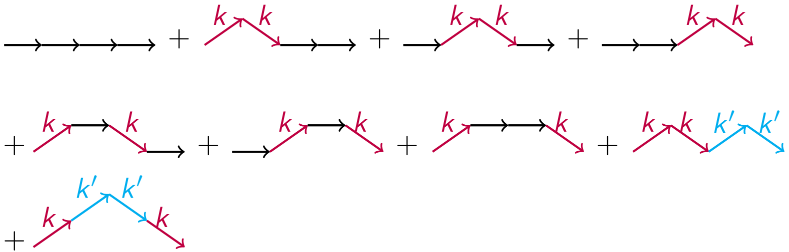
[Movassagh, Shor 2014]

- Still unique ground state with zero energy

Colored Motzkin spin model 3

[Movassagh, Shor 2014]

- Still unique ground state with zero energy
- Example) $2n = 4$ case,



$$|P_4\rangle = \frac{1}{\sqrt{1+6s+2s^2}}\Bigg[|0000\rangle + \sum_{k=1}^{s}\left\{\left|u^k d^k 00\right\rangle + \cdots + \left|u^k 00 d^k\right\rangle\right\} + \sum_{k,k'=1}^{s}\left\{\left|u^k d^k u^{k'} d^{k'}\right\rangle + \left|u^k u^{k'} d^{k'} d^k\right\rangle\right\}\Bigg].$$

Colored Motzkin spin model 4

[Movassagh, Shor 2014]

Entanglement entropy

- Paths from $(0,0)$ to (n,h), $P_n^{(0\to h)}$, have h unmatched up steps.
  Let $\tilde{P}_n^{(0\to h)}(\{\kappa_m\})$ be paths with the colors of unmatched up steps frozen.

  (unmatched up from height $(m-1)$ to m) $\to u^{\kappa_m}$

- Similarly,

$$P_n^{(h\to 0)} \to \tilde{P}_n^{(h\to 0)}(\{\kappa_m\}),$$

(unmatched down from height m to $(m-1)$) $\to d^{\kappa_m}$.

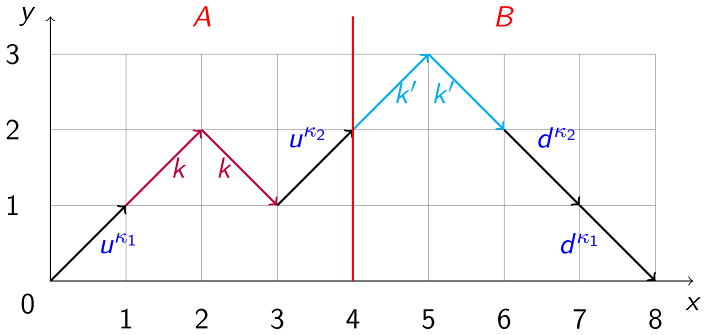
- The numbers satisfy $M_n^{(h)} = s^h\, \tilde{M}_n^{(h)}$.

Colored Motzkin spin model 5

[Movassagh, Shor 2014]

Example

$2n = 8$ case, $h = 2$



Colored Motzkin spin model 6 [Movassagh, Shor 2014]

- Schmidt decomposition

$$|P_{2n}\rangle = \sum_{h\geq 0}\sum_{\kappa_1=1}^{s}\cdots\sum_{\kappa_h=1}^{s}\sqrt{p_{n,n}^{(h)}} \times \left|\tilde{P}_n^{(0\to h)}(\{\kappa_m\})\right\rangle \otimes \left|\tilde{P}_n^{(h\to 0)}(\{\kappa_m\})\right\rangle$$

with

$$p_{n,n}^{(h)} = \frac{\left(\tilde{M}_n^{(h)}\right)^2}{M_{2n}}.$$

- Reduced density matrix

$$\rho_A = \sum_{h\geq 0}\sum_{\kappa_1=1}^{s}\cdots\sum_{\kappa_h=1}^{s} p_{n,n}^{(h)} \times \left|\tilde{P}_n^{(0\to h)}(\{\kappa_m\})\right\rangle\left\langle\tilde{P}_n^{(0\to h)}(\{\kappa_m\})\right|.$$

Colored Motzkin spin model 7

[Movassagh, Shor 2014]

- For $n \to \infty$,

$$p_{n,n}^{(h)} \sim \frac{\sqrt{2}\, s^{-h}}{\sqrt{\pi}\,(\sigma n)^{3/2}}\,(h+1)^2\, e^{-\frac{(h+1)^2}{2\sigma n}} \times [1 + O(1/n)]$$

with $\sigma \equiv \frac{\sqrt{s}}{2\sqrt{s}+1}$.

Note: Effectively $h \lesssim O(\sqrt{n})$.

- Entanglement entropy

$$S_A = -\sum_{h \geq 0} s^h\, p_{n,n}^{(h)} \ln p_{n,n}^{(h)}$$

Colored Motzkin spin model 7

[Movassagh, Shor 2014]

- For $n \to \infty$,

$$p_{n,n}^{(h)} \sim \frac{\sqrt{2}\, s^{-h}}{\sqrt{\pi}\,(\sigma n)^{3/2}} (h+1)^2 e^{-\frac{(h+1)^2}{2\sigma n}} \times [1 + O(1/n)]$$

with $\sigma \equiv \frac{\sqrt{s}}{2\sqrt{s}+1}$.

Note: Effectively $h \lesssim O(\sqrt{n})$.

- Entanglement entropy

$$\begin{aligned} S_A &= -\sum_{h \geq 0} s^h\, p_{n,n}^{(h)} \ln p_{n,n}^{(h)} \\ &= (2 \ln s)\sqrt{\frac{2\sigma n}{\pi}} + \frac{1}{2}\ln n + \frac{1}{2}\ln(2\pi\sigma) + \gamma - \frac{1}{2} - \ln s \end{aligned}$$

up to terms vanishing as $n \to \infty$.

Grows as $\sqrt{n}$.

Colored Motzkin spin model 8

[Movassagh, Shor 2014]

Comments

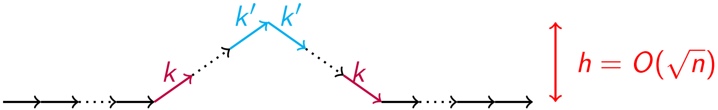
- Matching color $\Rightarrow$ s^{-h} factor in $p_{n,n}^{(h)}$
  $\Rightarrow$ crucial to $O(\sqrt{n})$ behavior in S_A

Colored Motzkin spin model 8

[Movassagh, Shor 2014]

Comments

- Matching color $\Rightarrow$ s^{-h} factor in $p_{n,n}^{(h)}$
  $\Rightarrow$ crucial to $O(\sqrt{n})$ behavior in S_A
- Typical configurations:



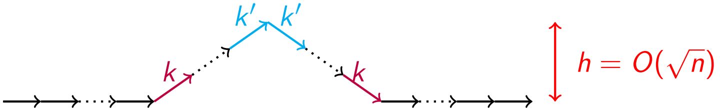
$+$ (equivalence moves).

Colored Motzkin spin model 8

[Movassagh, Shor 2014]

Comments

- Matching color $\Rightarrow$ s^{-h} factor in $p_{n,n}^{(h)}$
  $\Rightarrow$ crucial to $O(\sqrt{n})$ behavior in S_A
- Typical configurations:



$+$ (equivalence moves).

- For spin 1/2 chain (only up and down), the model in which similar behavior exhibits in colored as well as uncolored cases has been constructed. (Fredkin model) [Salberger, Korepin 2016]

Colored Motzkin spin model 9

[Movassagh, Shor 2014]

- Correlation functions

[Dell'Anna et al, 2016]

$$\langle S_{z,1} S_{z,2n} \rangle_{\mathrm{connected}} \to -0.034... \times \frac{s^3 - s}{6} \neq 0 \qquad (n \to \infty)$$

$\Rightarrow$ Violation of cluster decomposition property for $s > 1$

(Strong correlation due to color matching)

Colored Motzkin spin model 9

[Movassagh, Shor 2014]

- Correlation functions [Dell'Anna et al, 2016]

$$\langle S_{z,1} S_{z,2n} \rangle_{\mathrm{connected}} \to -0.034... \times \frac{s^3 - s}{6} \neq 0 \qquad (n \to \infty)$$

$\Rightarrow$ Violation of cluster decomposition property for $s > 1$

(Strong correlation due to color matching)

- Deformation of models to achieve the volume law behavior ($S_A \propto n$)

  Weighted Motzkin/Dyck walks [Zhang et al, Salberger et al 2016]

Symmetric Inverse Semigroups (SISs)

- Inverse Semigroup ($\subset$ Semigroup):
  An unique inverse exists for every element.
  But, no unique identity (partial identities).

Symmetric Inverse Semigroups (SISs)

$$x_{1,2} * x_{2,1} = x_{1,1}, \qquad x_{2,1} * x_{1,2} = x_{2,2}$$

(partial identities)

$(x_{1,2})^{-1} = x_{2,1}$ (unique inverse)

- $x_{a_1,a_2;\, b_1,b_2} \in \mathcal{S}_2^k$ etc, ... $\qquad \mathcal{S}_k^k \equiv S_k$

SIS Motzkin model 1

[Sugino, Padmanabhan 2017]

- Change the spin d.o.f. as $|x_{a,b}\rangle$ with $a, b \in \{1, 2, \cdots, k\}$.
- $a < b$ case: 'up' $\Leftrightarrow$ 
  $a > b$ case: 'down' $\Leftrightarrow$ 
  $a = b$ case: 'flat' $\Leftrightarrow$ 
SIS Motzkin model 1

[Sugino, Padmanabhan 2017]

- Change the spin d.o.f. as $|x_{a,b}\rangle$ with $a, b \in \{1, 2, \cdots, k\}$.
- $a < b$ case: 'up' $\Leftrightarrow$ 
  $a > b$ case: 'down' $\Leftrightarrow$ 
  $a = b$ case: 'flat' $\Leftrightarrow$ 
- We regard the configuration of adjacent sites $|(x_{a,b})_j\rangle\,|(x_{c,d})_{j+1}\rangle$ as a connected path for $b = c$.
  c.f.) Analogous to the product rule of Symmetric Inverse Semigroup ($\mathcal{S}_1^k$):

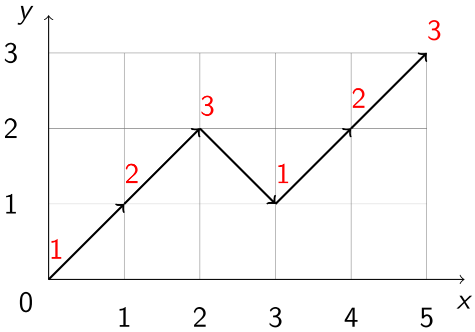
  $$x_{a,b} * x_{c,d} = \delta_{b,c}\, x_{a,d}$$

  a, b: semigroup indices
- Inner product: $\langle x_{a,b}|x_{c,d}\rangle = \delta_{a,c}\delta_{b,d}$
- Let us consider the $k = 3$ case.

SIS Motzkin model 2

[Sugino, Padmanabhan 2017]

- Maximum height is lower than the original Motzkin case.



SIS Motzkin model 3

[Sugino, Padmanabhan 2017]

Hamiltonian $H_{S31Motzkin} = H_{bulk} + H_{bulk,disc} + H_{bdy}$

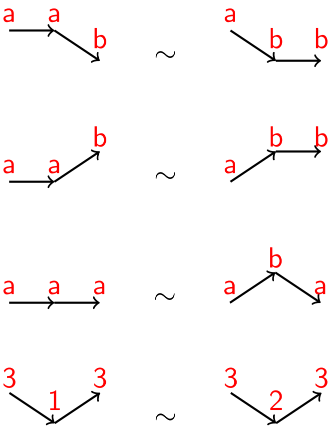
- H_{bulk}: local interactions corresponding to the following moves:

(*Down*) $\quad$ ($a > b$)

(*Up*) $\quad$ ($a < b$)

(*Flat*) $\quad$ ($a < b$)

(*Wedge*)



SIS Motzkin model 4

[Sugino, Padmanabhan 2017]

- $H_{bulk,disc}$ lifts disconnected paths to excited states.

$\Pi^{|\psi\rangle}$: projector to $|\psi\rangle$

$$H_{bulk,disc} = \sum_{j=1}^{2n-1} \sum_{a,b,c,d=1;b\neq c}^{3} \Pi^{\left|(x_{a,b})_j,(x_{c,d})_{j+1}\right\rangle}$$

SIS Motzkin model 4

[Sugino, Padmanabhan 2017]

- $H_{bulk,disc}$ lifts disconnected paths to excited states.

$\Pi^{|\psi\rangle}$: projector to $|\psi\rangle$

$$H_{bulk,disc} = \sum_{j=1}^{2n-1} \sum_{a,b,c,d=1;\, b\neq c}^{3} \Pi^{|(x_{a,b})_j,(x_{c,d})_{j+1}\rangle}$$

-

$$H_{bdy} = \sum_{a>b} \Pi^{|(x_{a,b})_1\rangle} + \sum_{a<b} \Pi^{|(x_{a,b})_{2n}\rangle} + \Pi^{|(x_{1,3})_1,(x_{3,2})_2,(x_{2,1})_3\rangle} + \Pi^{|(x_{1,2})_{2n-2},(x_{2,3})_{2n-1},(x_{3,1})_{2n}\rangle}$$

The last 2 terms have no analog to the original Motzkin model.

SIS Motzkin model 5

[Sugino, Padmanabhan 2017]

- Ground states correspond to connected paths starting at $(0,0)$, ending at $(2n,0)$ and not entering $y<0$. $\mathcal{S}_1^3$ MWs

SIS Motzkin model 5

[Sugino, Padmanabhan 2017]

- Ground states correspond to connected paths starting at $(0,0)$, ending at $(2n,0)$ and not entering $y<0$. $\mathcal{S}_1^3$ MWs
- The ground states have 5 fold degeneracy according to the initial and finial semigroup indices:
  $(1,1)$, $(1,2)$, $(2,1)$, $(2,2)$ and $(3,3)$ sectors
  The $(3,3)$ sector is trivial, consisting of only one path:
  $$x_{3,3}x_{3,3}\cdots x_{3,3}.$$

SIS Motzkin model 5

[Sugino, Padmanabhan 2017]

- Ground states correspond to connected paths starting at $(0,0)$, ending at $(2n,0)$ and not entering $y<0$. $\mathcal{S}_1^3$ MWs
- The ground states have 5 fold degeneracy according to the initial and finial semigroup indices:
  $(1,1)$, $(1,2)$, $(2,1)$, $(2,2)$ and $(3,3)$ sectors
  The $(3,3)$ sector is trivial, consisting of only one path:
  $$x_{3,3}x_{3,3}\cdots x_{3,3}.$$
- The number of paths can be obtained by recursion relations. For length-n paths from the semigroup index a to b ($P_{n,a\to b}$),

$$\begin{aligned}
P_{n,1\to 1} &= x_{1,1}P_{n-1,1\to 1} + x_{1,2}\sum_{i=1}^{n-2} P_{i,2\to 2}\,x_{2,1}P_{n-2-i,1\to 1} \\
&\quad + x_{1,3}\sum_{i=1}^{n-2} P_{i,3\to 3}\,x_{3,1}P_{n-2-i,1\to 1} \\
&\quad + x_{1,3}\sum_{i=1}^{n-2} P_{i,3\to 3}\,x_{3,2}P_{n-2-i,2\to 1}, \qquad \text{etc.}
\end{aligned}$$

SIS Motzkin model 6

[Sugino, Padmanabhan 2017]

Result

- The entanglement entropies $S_{A,1\to 1}$, $S_{A,1\to 2}$, $S_{A,2\to 1}$ and $S_{A,2\to 2}$ take the same form as in the case of the Motzkin model.

Logarithmic violation of the area law

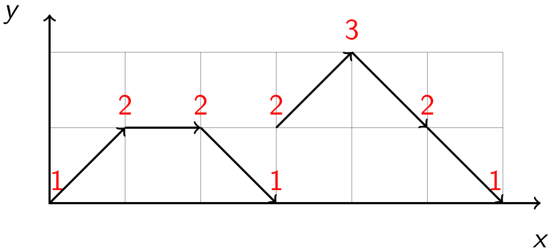
  - The form of $p_n^{(h)} \sim \frac{(h+1)^2}{n^{3/2}}\, e^{-(\text{const.})\frac{(h+1)^2}{n}}$ is universal.
- $S_{A,3\to 3} = 0$.

SIS Motzkin model 7

Localization

[Padmanabhan, F.S., Korepin 2018]

- There are excited states corresponding to disconnected paths.
  Example) One such path in $2n = 6$ case,

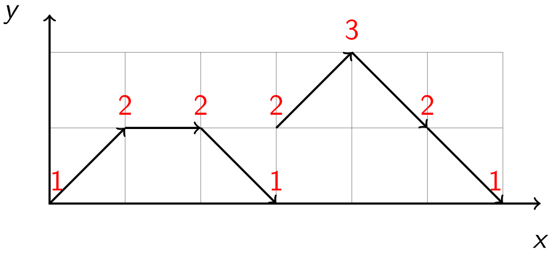


SIS Motzkin model 7

Localization

[Padmanabhan, F.S., Korepin 2018]

- There are excited states corresponding to disconnected paths.
  Example) One such path in $2n = 6$ case,



Corresponding excited state: $\left|P_{3,\,1\to1}\right\rangle \otimes \left|P^{(1\to0)}_{3,\,2\to1}\right\rangle$

Each connected component has no entanglement with other components.

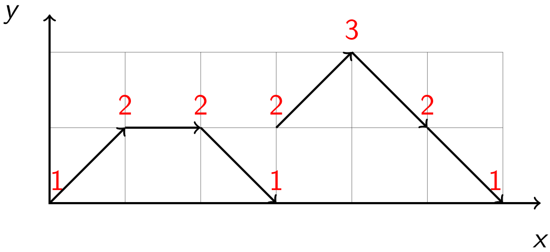
"2nd quantization" of paths

SIS Motzkin model 7

Localization

[Padmanabhan, F.S., Korepin 2018]

- There are excited states corresponding to disconnected paths.
  Example) One such path in $2n = 6$ case,



Corresponding excited state: $\left|P_{3,\,1\to 1}\right\rangle \otimes \left|P^{(1\to 0)}_{3,\,2\to 1}\right\rangle$

Each connected component has no entanglement with other components.

"2nd quantization" of paths

$\Rightarrow$ 2pt connected correlation functions of local operators belonging to separate connected components vanish.

$\Rightarrow$ Localization!

Colored SIS Motzkin model 1

[Sugino, Padmanabhan 2017]

The SIS $\mathcal{S}_2^3$

- 18 elements $x_{ab,cd}$ with $ab \in \{12, 23, 31\}$ and $cd \in \{12, 23, 31, 21, 32, 13\}$ satisfying

$$x_{ab,cd} * x_{ef,gh} = \delta_{c,e}\delta_{d,f}\, x_{ab,gh} + \delta_{c,f}\delta_{d,e}\, x_{ab,hg}.$$

- can be regarded as 2 sets of $\mathcal{S}_1^3$. $\Rightarrow$ color d.o.f.

- $$H_{bulk,disc} = \sum_{j=1}^{2n-1} \sum_{a,b,c,d=1;b\neq c}^{3} \sum_{s,t=1}^{2} \Pi^{\left|(x^s_{a,b})_j,(x^t_{c,d})_{j+1}\right\rangle}$$

- $$\begin{aligned} H_{bdy} &= \sum_{a>b} \sum_{s=1}^{2} \Pi^{\left|(x^s_{a,b})_1\right\rangle} + \sum_{a<b} \sum_{s=1}^{2} \Pi^{\left|(x^s_{a,b})_{2n}\right\rangle} \\ &+ \sum_{s,t=1}^{2} \Pi^{\left|(x^s_{1,3})_1,(x^s_{3,2})_2,(x^t_{2,1})_3\right\rangle} \\ &+ \sum_{s,t=1}^{2} \Pi^{\left|(x^s_{1,2})_{2n-2},(x^t_{2,3})_{2n-1},(x^t_{3,1})_{2n}\right\rangle} \end{aligned}$$

Colored SIS Motzkin model 5

[Sugino, Padmanabhan 2017]

- 5 ground states of $(1,1)$, $(1,2)$, $(2,1)$, $(2,2)$, $(3,3)$ sectors
- Quantum phase transition between $\mu > 0$ and $\mu = 0$ in the 4 sectors except $(3,3)$.
  - For $\mu > 0$,

$$S_A = (2\ln 2)\sqrt{\frac{2\sigma n}{\pi}} + \frac{1}{2}\ln n + \frac{1}{2}\ln(2\pi\sigma) + \gamma - \frac{1}{2} + \ln\frac{3}{2^{1/3}}$$

    with $\sigma \equiv \frac{\sqrt{2}-1}{9\sqrt{2}}$.
  - For $\mu = 0$, colors 1 and 2 decouple.

$$S_A \propto \ln n.$$

Rényi entropy

[Rényi, 1970]

- Rényi entropy has further importance than the von Neumann entanglement entropy:

$$S_{A,\alpha} = \frac{1}{1-\alpha} \ln \mathrm{Tr}_A \, \rho_A^{\alpha} \qquad \text{with } \alpha > 0 \text{ and } \alpha \neq 1.$$

Rényi entropy

[Rényi, 1970]

- Rényi entropy has further importance than the von Neumann entanglement entropy:

$$S_{A,\alpha} = \frac{1}{1-\alpha} \ln \mathrm{Tr}_A\, \rho_A^{\alpha} \qquad \text{with } \alpha > 0 \text{ and } \alpha \neq 1.$$

- Generalization of the von Neumann entanglement entropy: $\lim_{\alpha \to 1} S_{A,\alpha} = S_A$

Rényi entropy

[Rényi, 1970]

- Rényi entropy has further importance than the von Neumann entanglement entropy:

$$S_{A,\alpha} = \frac{1}{1-\alpha} \ln \mathrm{Tr}_A \, \rho_A^{\alpha} \qquad \text{with } \alpha > 0 \text{ and } \alpha \neq 1.$$

- Generalization of the von Neumann entanglement entropy: $\lim_{\alpha \to 1} S_{A,\alpha} = S_A$
- Reconstructs the whole spectrum of the entanglement Hamiltonian $H_{\mathrm{ent},A} \equiv -\ln \rho_A$.

Rényi entropy

[Rényi, 1970]

- Rényi entropy has further importance than the von Neumann entanglement entropy:

$$S_{A,\alpha} = \frac{1}{1-\alpha} \ln \mathrm{Tr}_A\, \rho_A^\alpha \qquad \text{with } \alpha > 0 \text{ and } \alpha \neq 1.$$

- Generalization of the von Neumann entanglement entropy: $\lim_{\alpha \to 1} S_{A,\alpha} = S_A$
- Reconstructs the whole spectrum of the entanglement Hamiltonian $H_{\mathrm{ent},A} \equiv -\ln \rho_A$.
- For $S_{A,\alpha}$ $(0 < \alpha < 1)$, the gapped systems in 1D is proven to obey the area law. [Huang, 2015]

Rényi entropy

[Rényi, 1970]

- Rényi entropy has further importance than the von Neumann entanglement entropy:

$$S_{A,\alpha} = \frac{1}{1-\alpha} \ln \mathrm{Tr}_A \, \rho_A^\alpha \qquad \text{with } \alpha > 0 \text{ and } \alpha \neq 1.$$

- Generalization of the von Neumann entanglement entropy: $\lim_{\alpha \to 1} S_{A,\alpha} = S_A$
- Reconstructs the whole spectrum of the entanglement Hamiltonian $H_{\mathrm{ent},A} \equiv -\ln \rho_A$.
- For $S_{A,\alpha}$ $(0 < \alpha < 1)$, the gapped systems in 1D is proven to obey the area law. [Huang, 2015]

Here, I give a review of Motzkin spin chain and analytically compute its Rényi entropy of half-chain.

New phase transition found at $\alpha = 1$!

Réyni entropy of Motzkin model 1 [F.S., Korepin, 2018]

- What we compute is the asymptotic behavior of

$$S_{A,\alpha} = \frac{1}{1-\alpha} \ln \sum_{h=0}^{n} s^h \left(p_{n,n}^{(h)} \right)^{\alpha} .$$

Réyni entropy of Motzkin model 1 [F.S., Korepin, 2018]

- What we compute is the asymptotic behavior of

$$S_{A,\,\alpha} = \frac{1}{1-\alpha}\, \ln \sum_{h=0}^{n} s^h \left(p_{n,n}^{(h)}\right)^{\alpha}.$$

- For colorless case $(s = 1)$, we obtain

$$\begin{aligned} S_{A,\alpha} &= \frac{1}{2}\ln n + \frac{1}{1-\alpha}\ln\Gamma\left(\alpha+\frac{1}{2}\right) \\ &\quad -\frac{1}{2(1-\alpha)}\left\{(1+2\alpha)\ln\alpha + \alpha\ln\frac{\pi}{24} + \ln 6\right\} \end{aligned}$$

up to terms vanishing as $n \to \infty$.

Réyni entropy of Motzkin model 1 [F.S., Korepin, 2018]

- What we compute is the asymptotic behavior of

$$S_{A,\alpha} = \frac{1}{1-\alpha} \ln \sum_{h=0}^{n} s^h \left(p_{n,n}^{(h)}\right)^{\alpha}.$$

- For colorless case ($s = 1$), we obtain

$$\begin{aligned} S_{A,\alpha} &= \frac{1}{2}\ln n + \frac{1}{1-\alpha}\ln\Gamma\left(\alpha + \frac{1}{2}\right) \\ &\quad - \frac{1}{2(1-\alpha)}\left\{(1+2\alpha)\ln\alpha + \alpha\ln\frac{\pi}{24} + \ln 6\right\} \end{aligned}$$

up to terms vanishing as $n \to \infty$.

  - Logarithmic growth
  - Reduces to S_A in the $\alpha \to 1$ limit.
  - Consistent with half-chain case in the result in [Movassagh, 2017]

Réyni entropy of Motzkin model 2

[F.S., Korepin, 2018]

Colored case ($s > 1$)

- The summand $s^h \left(p_{n,n}^{(h)}\right)^\alpha$ has a factor $s^{(1-\alpha)h}$.

Réyni entropy of Motzkin model 2 [F.S., Korepin, 2018]

Colored case ($s > 1$)

- The summand $s^h \left(p_{n,n}^{(h)}\right)^\alpha$ has a factor $s^{(1-\alpha)h}$.
  For $0 < \alpha < 1$, exponentially growing (colored case ($s > 1$)).
  $\Rightarrow$ Saddle point value of the sum: $h_* = O(n)$

Réyni entropy of Motzkin model 2 [F.S., Korepin, 2018]

Colored case ($s > 1$)

- The summand $s^h \left(p_{n,n}^{(h)}\right)^\alpha$ has a factor $s^{(1-\alpha)h}$.
  For $0 < \alpha < 1$, exponentially growing (colored case ($s > 1$)).
  $\Rightarrow$ Saddle point value of the sum: $h_* = O(n)$
- Saddle point analysis for the sum leads to

$$S_{A,\alpha} = n\frac{2\alpha}{1-\alpha}\ln\left[\sigma\left(s^{\frac{1-\alpha}{2\alpha}} + s^{-\frac{1-\alpha}{2\alpha}} + s^{-1/2}\right)\right] + \frac{1+\alpha}{2(1-\alpha)}\ln n + C(s,\alpha)$$

with $C(s,\alpha)$ being n-independent terms.

Réyni entropy of Motzkin model 2

[F.S., Korepin, 2018]

Colored case ($s > 1$)

- The summand $s^h \left(p_{n,n}^{(h)}\right)^\alpha$ has a factor $s^{(1-\alpha)h}$.
  For $0 < \alpha < 1$, exponentially growing (colored case ($s > 1$)).
  $\Rightarrow$ Saddle point value of the sum: $h_* = O(n)$
- Saddle point analysis for the sum leads to

$$S_{A,\alpha} = n\frac{2\alpha}{1-\alpha}\ln\left[\sigma\left(s^{\frac{1-\alpha}{2\alpha}} + s^{-\frac{1-\alpha}{2\alpha}} + s^{-1/2}\right)\right] + \frac{1+\alpha}{2(1-\alpha)}\ln n + C(s,\alpha)$$

  with $C(s,\alpha)$ being n-independent terms.
  - The saddle point value is $h_* = n\frac{s^{\frac{1}{2\alpha}} - s^{1-\frac{1}{2\alpha}}}{s^{\frac{1}{2\alpha}} + s^{1-\frac{1}{2\alpha}} + 1} + O(n^0)$.

Réyni entropy of Motzkin model 2 [F.S., Korepin, 2018]

Colored case ($s > 1$)

- The summand $s^h \left(p_{n,n}^{(h)}\right)^\alpha$ has a factor $s^{(1-\alpha)h}$.
  For $0 < \alpha < 1$, exponentially growing (colored case ($s > 1$)).
  $\Rightarrow$ Saddle point value of the sum: $h_* = O(n)$
- Saddle point analysis for the sum leads to

$$S_{A,\alpha} = n\frac{2\alpha}{1-\alpha} \ln\left[\sigma\left(s^{\frac{1-\alpha}{2\alpha}} + s^{-\frac{1-\alpha}{2\alpha}} + s^{-1/2}\right)\right] + \frac{1+\alpha}{2(1-\alpha)} \ln n + C(s,\alpha)$$

  with $C(s,\alpha)$ being n-independent terms.
  - The saddle point value is $h_* = n\frac{s^{\frac{1}{2\alpha}} - s^{1-\frac{1}{2\alpha}}}{s^{\frac{1}{2\alpha}} + s^{1-\frac{1}{2\alpha}} + 1} + O(n^0)$.
  - Linear growth in n.

Réyni entropy of Motzkin model 2

[F.S., Korepin, 2018]

Colored case ($s > 1$)

- The summand $s^h \left(p_{n,n}^{(h)}\right)^\alpha$ has a factor $s^{(1-\alpha)h}$.
  For $0 < \alpha < 1$, exponentially growing (colored case ($s > 1$)).
  $\Rightarrow$ Saddle point value of the sum: $h_* = O(n)$
- Saddle point analysis for the sum leads to

$$S_{A,\alpha} = n\frac{2\alpha}{1-\alpha} \ln\left[\sigma\left(s^{\frac{1-\alpha}{2\alpha}} + s^{-\frac{1-\alpha}{2\alpha}} + s^{-1/2}\right)\right] + \frac{1+\alpha}{2(1-\alpha)} \ln n + C(s,\alpha)$$

  with $C(s,\alpha)$ being n-independent terms.
  - The saddle point value is $h_* = n\frac{s^{\frac{1}{2\alpha}} - s^{1-\frac{1}{2\alpha}}}{s^{\frac{1}{2\alpha}} + s^{1-\frac{1}{2\alpha}} + 1} + O(n^0)$.
  - Linear growth in n.
  - Note: $\alpha \to 1$ or $s \to 1$ limit does not commute with the $n \to \infty$ limit.

Réyni entropy of Motzkin model 3

[F.S., Korepin, 2018]

Rényi entropy for $\alpha > 1$

- For $\alpha > 1$, the factor $s^{(1-\alpha)h}$ in the summand $s^h \left(p_{n,n}^{(h)}\right)^\alpha$ exponentially decays.

Réyni entropy of Motzkin model 3 [F.S., Korepin, 2018]

Rényi entropy for $\alpha > 1$

- For $\alpha > 1$, the factor $s^{(1-\alpha)h}$ in the summand $s^h \left(p_{n,n}^{(h)}\right)^\alpha$ exponentially decays.
  $\Rightarrow h \lesssim O\left(\frac{1}{(\alpha-1)\ln s}\right) = O(n^0)$ dominantly contributes to the sum.

Réyni entropy of Motzkin model 3 [F.S., Korepin, 2018]

Rényi entropy for $\alpha > 1$

- For $\alpha > 1$, the factor $s^{(1-\alpha)h}$ in the summand $s^h \left(p_{n,n}^{(h)}\right)^\alpha$ exponentially decays.
  $\Rightarrow h \lesssim O\left(\frac{1}{(\alpha-1)\ln s}\right) = O(n^0)$ dominantly contributes to the sum.
- The result:

$$S_{A,\alpha} = \frac{3\alpha}{2(\alpha-1)} \ln n + O(n^0).$$

Réyni entropy of Motzkin model 3 [F.S., Korepin, 2018]

Rényi entropy for $\alpha > 1$

- For $\alpha > 1$, the factor $s^{(1-\alpha)h}$ in the summand $s^h \left(p_{n,n}^{(h)}\right)^\alpha$ exponentially decays.
  $\Rightarrow h \lesssim O\left(\frac{1}{(\alpha-1)\ln s}\right) = O(n^0)$ dominantly contributes to the sum.
- The result:

$$S_{A,\alpha} = \frac{3\alpha}{2(\alpha-1)} \ln n + O(n^0).$$

  - Logarithmic growth

Réyni entropy of Motzkin model 3

[F.S., Korepin, 2018]

Rényi entropy for $\alpha > 1$

- For $\alpha > 1$, the factor $s^{(1-\alpha)h}$ in the summand $s^h \left(p_{n,n}^{(h)}\right)^\alpha$ exponentially decays.
  $\Rightarrow h \lesssim O\left(\frac{1}{(\alpha-1)\ln s}\right) = O(n^0)$ dominantly contributes to the sum.
- The result:

$$S_{A,\alpha} = \frac{3\alpha}{2(\alpha-1)} \ln n + O(n^0).$$

  - Logarithmic growth
  - $\alpha \to 1$ or $s \to 1$ limit does not commute with the $n \to \infty$ limit.

Réyni entropy of Motzkin model 4

[F.S., Korepin, 2018]

Phase transition

- $S_{A\,\alpha}$ grows as $O(n)$ for $0 < \alpha < 1$ while as $O(\ln n)$ for $\alpha > 1$.

Réyni entropy of Motzkin model 4

[F.S., Korepin, 2018]

Phase transition

- $S_{A\,\alpha}$ grows as $O(n)$ for $0 < \alpha < 1$ while as $O(\ln n)$ for $\alpha > 1$.
  $\Rightarrow$ Non-analytic behavior at $\alpha = 1$ (Phase transition)

Réyni entropy of Motzkin model 4 [F.S., Korepin, 2018]

Phase transition

- $S_{A\,\alpha}$ grows as $O(n)$ for $0 < \alpha < 1$ while as $O(\ln n)$ for $\alpha > 1$.
  $\Rightarrow$ Non-analytic behavior at $\alpha = 1$ (Phase transition)
- In terms of the entanglement Hamiltonian,
  $\mathrm{Tr}_A\,\rho_A^{\alpha} = \mathrm{Tr}_A\,e^{-\alpha H_{\mathrm{ent},\,A}}$ α: "inverse temperature"

Réyni entropy of Motzkin model 4

[F.S., Korepin, 2018]

Phase transition

- $S_{A\,\alpha}$ grows as $O(n)$ for $0 < \alpha < 1$ while as $O(\ln n)$ for $\alpha > 1$.
  $\Rightarrow$ Non-analytic behavior at $\alpha = 1$ (Phase transition)
- In terms of the entanglement Hamiltonian,
  $\mathrm{Tr}_A\, \rho_A^{\alpha} = \mathrm{Tr}_A\, e^{-\alpha H_{\mathrm{ent},\,A}}$ α: "inverse temperature"
  - $0 < \alpha < 1$: "high temperature"
    (Height of dominant paths $h = O(n)$)
  - $\alpha > 1$: "low temperature"
    (Height of dominant paths $h = O(n^0)$)

Réyni entropy of Motzkin model 4 [F.S., Korepin, 2018]

Phase transition

- $S_{A\,\alpha}$ grows as $O(n)$ for $0 < \alpha < 1$ while as $O(\ln n)$ for $\alpha > 1$.
  $\Rightarrow$ Non-analytic behavior at $\alpha = 1$ (Phase transition)
- In terms of the entanglement Hamiltonian,

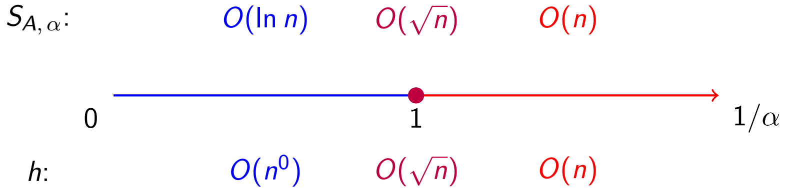
  - $0 < \alpha < 1$: "high temperature"
    (Height of dominant paths $h = O(n)$)
  - $\alpha > 1$: "low temperature"
    (Height of dominant paths $h = O(n^0)$)
- The transition point $\alpha = 1$ itself forms the third phase.



Summary and discussion 1

Summary

- We have reviewed the (colored) Motzkin spin models which yield large entanglement entropy proportional to the square root of the volume.

Summary and discussion 1

Summary

- We have reviewed the (colored) Motzkin spin models which yield large entanglement entropy proportional to the square root of the volume.
- We have extended the models by introducing additional d.o.f. based on Symmetric Inverse Semigroups.
  - Quantum phase transitions
    In uncolored case ($\mathcal{S}_1^3$), log. violation v.s. area law $O(1)$ for S_A
    In colored case ($\mathcal{S}_2^3$), $\sqrt{n}$ v.s. $\ln n$ for S_A.

Summary and discussion 1

Summary

- We have reviewed the (colored) Motzkin spin models which yield large entanglement entropy proportional to the square root of the volume.
- We have extended the models by introducing additional d.o.f. based on Symmetric Inverse Semigroups.
  - Quantum phase transitions
    In uncolored case ($\mathcal{S}_1^3$), log. violation v.s. area law $O(1)$ for S_A
    In colored case ($\mathcal{S}_2^3$), $\sqrt{n}$ v.s. $\ln n$ for S_A.
- Semigroup extension of the Fredkin model

[Padmanabhan, F.S., Korepin 2018]

Summary

- We have reviewed the (colored) Motzkin spin models which yield large entanglement entropy proportional to the square root of the volume.
- We have extended the models by introducing additional d.o.f. based on Symmetric Inverse Semigroups.
  - Quantum phase transitions
    In uncolored case ($\mathcal{S}_1^3$), log. violation v.s. area law $O(1)$ for S_A
    In colored case ($\mathcal{S}_2^3$), $\sqrt{n}$ v.s. $\ln n$ for S_A.
- Semigroup extension of the Fredkin model

  [Padmanabhan, F.S., Korepin 2018]
- As a feature of the extended models,
  Anderson-like localization occurs in excited states corresponding to disconnected paths.
  - "2nd quantized paths".

Summary and discussion 2

Summary

- We have analytically computed the Rényi entropy of half-chain in the Motzkin model.
  - Phase transition at $\alpha = 1$ (New phase transition!)
    No analog for other spin chains investigated so far (XX, XY, AKLT,...).

Summary and discussion 2

Summary

- We have analytically computed the Rényi entropy of half-chain in the Motzkin model.
  - Phase transition at $\alpha = 1$ (New phase transition!)
    No analog for other spin chains investigated so far (XX, XY, AKLT,...).
  - For $0 < \alpha < 1$ ("high temperature"), $S_{A,\alpha} = O(n)$.
  - For $\alpha > 1$ ("low temperature"), $S_{A,\alpha} = O(\ln n)$.

Summary and discussion 2

Summary

- We have analytically computed the Rényi entropy of half-chain in the Motzkin model.
  - Phase transition at $\alpha = 1$ (New phase transition!)
    No analog for other spin chains investigated so far (XX, XY, AKLT,...).
  - For $0 < \alpha < 1$ ("high temperature"), $S_{A,\alpha} = O(n)$.
  - For $\alpha > 1$ ("low temperature"), $S_{A,\alpha} = O(\ln n)$.
- We also have a similar result for the Fredkin spin chain.

[F.S., Korepin, 2018]

  - For $\alpha > 1$ ("low temperature"), $S_{A,\alpha} = O(\ln n)$.
- We also have a similar result for the Fredkin spin chain.

  [F.S., Korepin, 2018]
- Rényi entropy of chain of general length (in progress)
  Our conjecture: the same phase transition occurs for chain of general length

Summary and discussion 3

Future directions

- Continuum limit? (In particular, for colored case)

  [Chen, Fradkin, Witczak-Krempa 2017]

Summary and discussion 3

Future directions

- Continuum limit? (In particular, for colored case)

  [Chen, Fradkin, Witczak-Krempa 2017]

- Holography? Application to quantum gravity or black holes?

  [Alexander, Klich 2018]

- Higher-dimensional models ($d = 2, 3, ...$)?

Summary and discussion 3

Thank you very much for your attention!

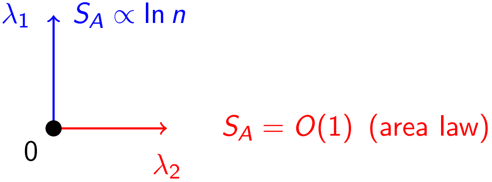
App. SIS Motzkin model

[Sugino, Padmanabhan 2017]

- By adding the balancing term to the Hamiltonian

$$\lambda_2 \sum_{j=1}^{2n-1} \left[\Pi^{\left|(x_{1,3})_j,(x_{3,2})_{j+1}\right\rangle} + \Pi^{\left|(x_{2,3})_j,(x_{3,1})_{j+1}\right\rangle} \right]$$

with λ_1 put to the term 
$\sim$ 
, quantum phase transition takes place in the 4 sectors except $(3,3)$:



$\lambda_1, \lambda_2 > 0$ is not frustration free (here, we do not consider).
