

# Volatility in Vegetable Market

A US case study

Qamar Fraz

Nonlinear Timeseries Analysis  
Prof. Robert Kunst

## Vegetable Market

- ▶ Producers
- ▶ Middleman
- ▶ Retailers
- ▶ consumers

## Input Market

- ▶ Fertilizer
- ▶ Pesticide
- ▶ Seed
- ▶ Machinery

Indicators:

## Efficiency of Market

- ▶ Market information
- ▶ No. Of intermediaries
- ▶ Technology
- ▶ Prices
- ▶ Govt, Regulation

# Risks

- ▶ Financial risk (speculation, price fluctuation, hoarding)
- ▶ Physical risk (Floods, damage(field to market), pest attack, diseases)

# Market stability

- ▶ Subsidy on inputs
- ▶ Support price to output
- ▶ Relief to consumers
- ▶ Technology

# vegetables

- ▶ Fresh vegetables: more vulnerable
- ▶ Canned vegetables
- ▶ Frozen vegetables

# Risk Measurement or Market Efficiency

## ▶ Volatility:

- Volatility is found by calculating the annualized standard deviation of daily change in price. If the price of a stock moves up and down rapidly over short time periods, it has high volatility. If the price almost never changes, it has low volatility.

## Data:

- ▶ Vegetables and Melons Yearbook for 2009, US department of Agriculture
- ▶ Economics, Statistics and Market Information System (ESMIS)

<http://usda.mannlib.cornell.edu/MannUsda/viewDocumentInfo.do?documentID=1212>

# Data

- ▶ Producer Price Index PPI (Fresh, Canned and Frozen vegetables)
  - ▶ Consumer Price Index
  - ▶ Range: 1979–2009 (1982=100 Base year)
  - ▶ Monthly Data
  - ▶ First Month differenced data is used for analysis
- 

# GARCH

$$X_t = \sigma_t \varepsilon_t,$$

$$\sigma_t^2 = c_0 + \sum_{j=1}^p b_j X_{t-j}^2 + \sum_{j=1}^q a_j \sigma_{t-j}^2,$$

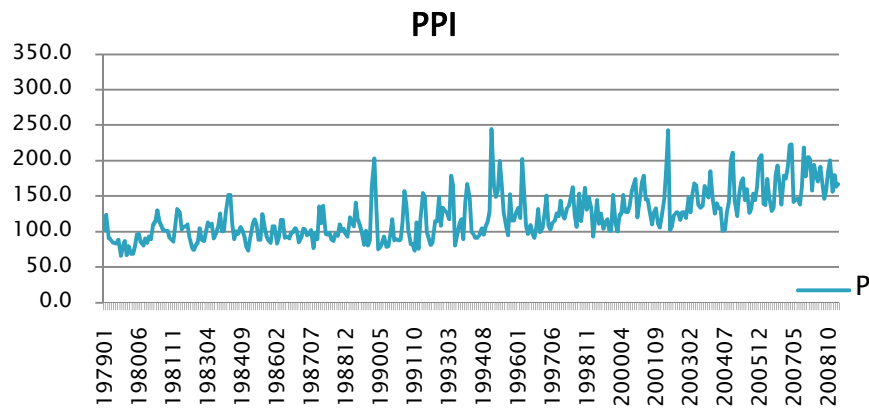

- ▶ The GARCH(p, q) has unique strictly covariance stationary solution iff

$$\sum_{j=1}^p b_j + \sum_{j=1}^q a_j < 1.$$

# Results

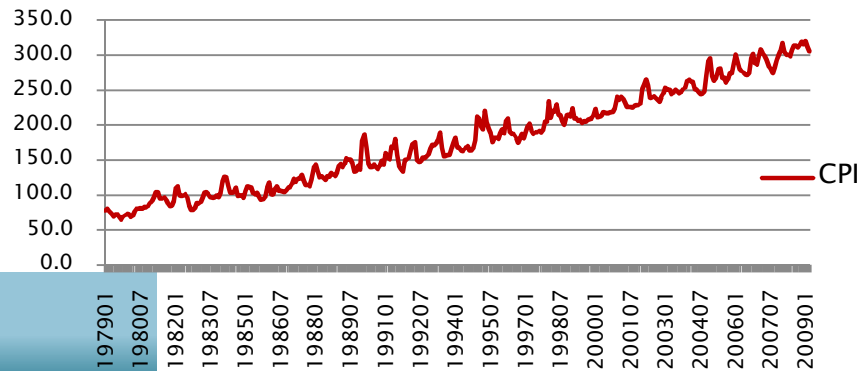

## PPI = Fresh Vegetables

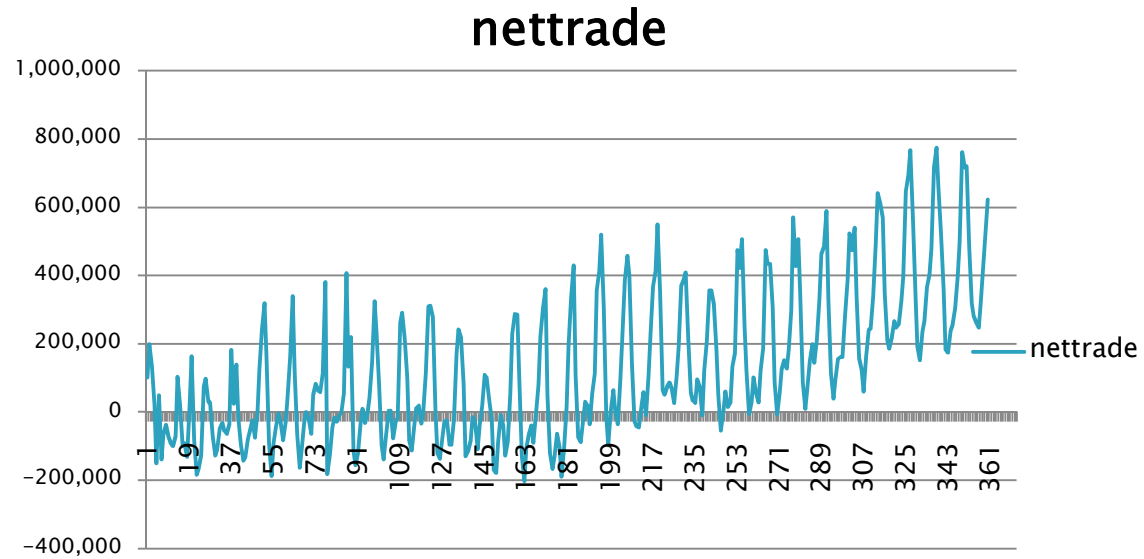

## PPIall = Fresh + Canned + Frozen

## CPI

# Net Trade (Imports-Exports)

Imports are increasing over the years and very much seasonal

# PPI–Fresh Vegetables

Dependent Variable: DPPI

Method: ML - ARCH (Marquardt) - Normal distribution

Presample variance: backcast (parameter = 0.7)

GARCH = C(2) + C(3)\*RESID(-1)^2 + C(4)\*GARCH(-1)

	Coefficient	Std. Error	z-Statistic	Prob.

# conclusion

- ▶ Producers risks positively shifts to consumers as the volatility of CPI and PPI is serially correlated positively.
- ▶ Fresh vegetable market is more risky and fluctuative in nature unless it is stabilized by canned and frozen vegetables which has less fluctuations but high cost over the years
- ▶ More things to do.....
