

“Limited Rationality and Strategic Interaction. The Impact of the Strategic Environment on Nominal Inertia” by Ernst Fehr and Jean-Robert Tyran

## **Supplementary Materials 1: Overview**

**Appendices** (see file **Supplementary Materials\_2\_appendices.doc**)

Appendix B contains a translation of the original instructions (from German) for CT, type  $y$ . The instructions for CT type  $x$  and ST (both types) only differ by the numerical examples explaining how to read the payoff tables.

Appendix C contains Tables C1-C4 for the post-shock phase with real payoffs and highlighted best replies. These tables are included to facilitate understanding for the reader (the tables that were used in CT and ST were nominal and had no highlighting).

Appendix D contains Tables D1-D4 for the post-shock phase with nominal payoffs as they were used in CT and ST.

**Data** (see file **Supplementary Materials\_3\_Alldata.xls**)

This excel-file contains the dataset used in the paper. The variables are labeled in line one and those labels that are not self-explanatory have “comments” attached (move mouse on cells with red triangles to see comments).

**Programs etc.** (see folder **Supplementary Materials\_4\_Programs etc**)

The main and the control treatments use the same programs and procedures. However, payoff tables and instructions differ. The supplementary materials include the full set of payoff tables, instructions, and programs (z-tree) for all 4 control treatments. In addition, a script for experimenters is added.
