Reflection conditions

General:

- hkl : $-h + k + l = 3n$
 $hki0$: $-h + k = 3n$
 $hh\bar{2}hl$: $l = 3n$
 $hh0l$: $h + l = 3n, l = 2n$
 $000l$: $l = 6n$
 $hh00$: $h = 3n$

Special: as above, plus

no extra conditions

Example Space group $R\bar{3}c$ (No. 167) (Int. Tables, [1])

- Symmetry operation number (10): glide mirror plane $g(1/6, -1/6, 5/6) x + 1/2, \bar{x}, z$:
 1. mirror all points of the unit cell at the plane $x + 1/2, \bar{x}, z$
 2. translate the points by the fractional vector $(1/6, -1/6, 5/6)$
- The “General position” number (10), $\bar{y}, \bar{x}, z + 1/3$:

$$x' = R_{11}x + R_{12}y + R_{13}z + t_1$$

$$y' = R_{21}x + R_{22}y + R_{23}z + t_2$$

$$z' = R_{31}x + R_{32}y + R_{33}z + t_3$$

$$\begin{pmatrix} \bar{y} \\ \bar{x} \\ z + 1/3 \end{pmatrix} = \begin{pmatrix} 0 & -1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} + \begin{pmatrix} 0 \\ 0 \\ 1/3 \end{pmatrix}$$

2 Choosing the Unit Cell

Unit Cell

- the entire crystal can be created by translations of the unit cell
- the unit cell is described by the three unit cell lengths a , b , c and the respective angles α , β , and γ .
- the unit cell is not unique

Unit Cell — Overview

- the primitive cell
- the asymmetric unit
- 7 crystal classes
- 14 Bravais lattices

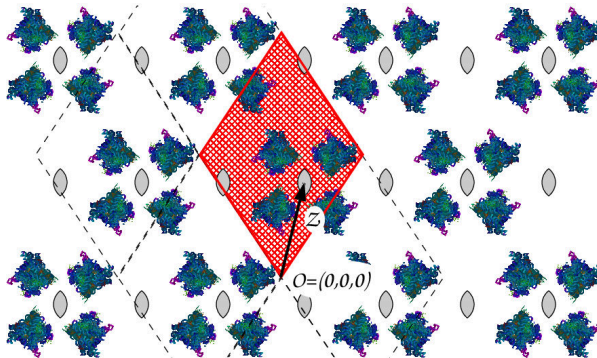

Choice of Unit Cell

The space group and the symmetry of the crystal is given by the crystal.

- The position of the molecules determines the position of the symmetry operators
- Here: **2-fold** rotation axes (not 4-fold!)

Choice of Unit Cell

- Uni cell: Mathematical construct, molecules are “ignorant” of the unit cell
- Condition for unit cell: integer translations cover the entire crystal

- If placed arbitrarily: matrix description becomes awkward:

$$(x'y'z') = R((xyz) - Z) + Z$$

Choice of Unit Cell

- Place origin of unit cell with position of one of the symmetry elements:
simplifies matrix description:

$$(x'y'z') = R(xyz)$$

Choice of Unit Cell

Every crystal possesses a unit cell with no symmetry element *inside* the cell. This unit cell is named the **primitive cell**.

Choice of Unit Cell

- The **primitive cell** does not necessarily reflect the crystal symmetry
- here: 2-fold axes, but angles $\neq 90^\circ$
- By convention: choose as unit cell the smallest cell which reflects the symmetry, e.g. trigonal (3-fold rotation axis) or hexagonal (6-fold rotation axis) system : $\gamma = 120^\circ$
