

Chemical Crystallography and Structural Chemistry

VO 270063

Lecture N° 1 — 7th March 2024

Dr. Tim Grüne
Core Facility for Crystal Structure Analysis
Faculty of Chemistry
University of Vienna
tim.gruene@univie.ac.at

1 Administrativa

Course Context

The lecture *Chemical Crystallography and Structural Chemistry*

- addresses Master students and PhD students of chemistry, or other disciplines, who want to understand structure determination with crystallography
- is part of module CH-TPA-07 (Master Chemistry)
 - 270063 VO Chemical Crystallography and Structural Chemistry
 - 270166 VO Powder Diffraction and Rietveld Refinement
 - XXXXXX PR Practical on Chemical Crystallography (winter term as of 2024W)

Contact Details

- Email: tim.gruene@univie.ac.at
- Office: 2E19
- Phone: +43-1-4277-70202
- Core Facility CCSA: <https://ccsa.univie.ac.at>
- personal homepage with lecture notes etc.:
<https://homepage.univie.ac.at/tim.gruene>

Course Details

- Place: Seminarraum 4
- Time: 90 minutes lecture Thursdays, 10:15am – 11:45am
- every fourth lecture will be an exercise in groups

Course Details

| | | | | | |
|------------------|-------|---------------------------|------------------|-------|---------------------------|
| 7 rd | March | Lecture N ^o 1 | 14 th | March | Lecture N ^o 2 |
| 21 st | March | – | 11 th | April | Lecture N ^o 3 |
| 18 th | April | Exercise N ^o 1 | 25 th | April | Lecture N ^o 4 |
| 2 nd | May | Lecture N ^o 5 | 16 th | May | Exercise N ^o 2 |
| 23 rd | May | Lecture N ^o 6 | 6 th | June | Lecture N ^o 7 |
| 13 th | June | Lecture N ^o 8 | 20 th | June | Exercise N ^o 3 |
| 27 th | June | Lecture N ^o 9 | | | |

- You are welcome to interrupt at any time and ask questions or comment
- Lecture notes will be made available online
- <https://homepage.univie.ac.at/tim.gruene/teaching/chemcryst>

Examination

There will be an **oral** exam with individual appointments.

2 Course Objective and Ressources

Chemical Crystallography

Understanding the value of a chemical structure in chemical research

Crystal structure of sucrose, with hydrogen bonds

- how to understand a crystal structure / CIF file?
- what do we learn from a crystal structure?
- what are the **limits** of crystallography
- how can we judge the quality of a crystal structure — are the conclusions justified?

Literature for Crystallography

Rupp [1]

Massa [3]

various [5]

Luger [2]

Muller et al. [4]

Giacovazzo [6]

Complete list of references are available at the end of slides, p.85

Journals for Chemical Crystallography

- Acta Crystallographica A–F journals.iucr.org: International Union of Crystallography
- Zeitschrift für Kristallographie, <https://www.degruyter.com/journal/key/ZKRI/html>
- Angewandte Chemie Int. Ed. <http://www.angewandte.org>, GDCh
- JACS, Journal of the American Chemical Society <https://pubs.acs.org/journal/jacsat>

and most other journals for chemistry

Crystallographic databases

Most journals require the deposition of structural data structures at publicly available data bases. Crystallography has long been a pioneering discipline of open access data.

Cambridge Structural Database

Crystallography Open Database

Inorganic Crystal Structure Database

Protein Data Bank

CRYSTMET®

Cambridge Structural Database (CSD)

- <http://www.ccdc.cam.ac.uk>
- founded 1965
- Single crystal and powder diffraction
- organic and metal-organic compounds
- > 1,200,000 entries, $\approx 50,000$ /year
- X-ray, neutron, and electron diffraction
- “The world repository of small molecule crystal structures”

Crystallography Open Database (COD)

- <http://www.crystallography.net>
- Local version available free of charge
- Can be browsed (by journal, by year,...)
- Organic and inorganic structures (minerals)
- “Open-access collection of crystal structures of organic, inorganic, metal-organics compounds and minerals, excluding biopolymers.”
- All data from IUCr journals, and from American Mineralogist CSD
- > 500,000 entries, $\approx 50,000$ /year

Inorganic Crystal Structure Database (ICSD)

- <https://icsd.fiz-karlsruhe.de/>
- inorganic and intermetallic structures
- only licensed access
- > 291,000 entries
- curated

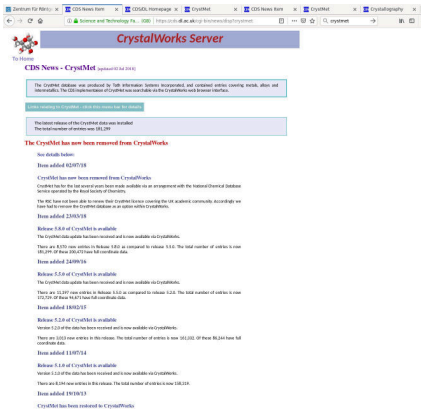

Protein Data Bank (PDB)

- <https://www.pdb.org>
- Search from
 - www.rcsb.org
 - <https://www.ebi.ac.uk/pdbe>
 - <https://pdj.org> (Japanese)
- polypeptides (proteins) and polysaccharides (nucleic acids)
- Crystal structures, NMR structures, EM structures
- Since 2007: data **must** be submitted along with coordinates
- > 215,000 structures (+1 Mio computed structures, cf AlphaFold)

CrystMET

- <https://cds.dl.ac.uk/cds/datasets/crys/mdf/11mdf.html>
- Crystal structure data for metals and alloys
- licensed access only

The screenshot shows a web browser window displaying the 'CrystalWorks Server' website. The page title is 'CrystalWorks Server'. Below the title, there is a section titled 'CDS News - CrystMet' with a sub-header '(updated 10/10/2024)'. The main content of the page is a news article with the following text:

The CrystalWorks site underwent a full information systems restructure, and copyright notices covering metals, alloys and intermetallics. The CDS implementation of CrystMet was available via the CrystalWorks web browser interface.

CrystMet has now been removed from CrystalWorks

The regular release of the CrystalWorks site was finished. The total number of entries was 181,209.

The CrystMet has now been removed from CrystalWorks.

See details below:

Been added 02/07/18

CrystMet has now been removed from CrystalWorks

CrystMet has for the last several years been made available via an arrangement with the National Crystallographic Service operated by the Royal Society of Chemistry.

The RSC has not been able to renew their CrystalWorks licence covering the UK academic community, accordingly we have had to remove the CrystalWorks database via our website to copyright.

Been added 23/03/18

Release 3.0.0 of CrystMet is available

The CrystalWorks update has been received and is now available via CrystalWorks.

There are 6,975 new entries in Release 3.0.0 as compared to release 2.9.0. The total number of entries is now 181,209 of these 180,473 have full coordinate data.

Been added 24/09/16

Release 2.9.0 of CrystMet is available

The CrystalWorks update has been received and is now available via CrystalWorks.

There are 12,077 new entries in Release 2.9.0 as compared to release 2.8.0. The total number of entries is now 182,209 of these 181,476 have full coordinate data.

Been added 18/02/12

Release 2.8.0 of CrystMet is available

Version 2.8.0 of the data has been received and is now available via CrystalWorks.

There are 1027 new entries in this release. The total number of entries is now 181,202 of these 181,244 have full coordinate data.

Been added 11/07/14

Release 3.1.0 of CrystMet is available

Version 3.1.0 of the data has been received and is now available via CrystalWorks.

There are 1,106 new entries in this release. The total number of entries is now 178,232.

Been added 19/08/13

CrystMet has been installed to CrystalWorks

3 Structure, Data, Data Formats, and Visualisation Software

Structural Data: the CIF-file

- Main file format for published structures
- available from CSD, COD, ICSD, journal web-sites, etc
- pure text file
- Can and should contain both structure information (coordinates) and experimental data (hkl-file)

Structural Data: the RES-file

- RES/INS text file: chemical structure in computer language
- developed by George Sheldrick (SHELX programs), late 1960s
- highly sophisticated format for chemical compounds — many programs, including MERCURY, can be overwhelmed
- “work” format: refinement and model building

Platon: Validation, format conversion

<http://www.cryst.chem.uu.nl/spek/platon>

→ 984199_sx.ins and 984199_sx.hkl

ShelXle: Visualisation and Modelling

<https://www.shelxle.org/shelx>

```

```

```
peroxo-08.res extracted, checksum O.K.
```

```
peroxo-08.hkl extracted, checksum O.K.
```

4 Crystals and Crystal Growth

Crystal Types

- Crystal = Solid state compound with regular composition
- interactions responsible for crystallisation
 1. ionic bond
 2. metallic bond
 3. covalent bond
 4. van-der-Waals interaction
- often not a clear cut between these types
- crystallography can characterise bond types

Ionic Crystals

- Composed of anions (negative charge) and cations (positive charge)
- Geometry according to Pauling's rules [8]

Simple example: $NaCl$:

- cubic lattice
- energy difference $Na + Cl \rightarrow Na^+ + Cl^-: -6.4eV$

Chrome alum,
i.e. Chromium(III) potassium sulfate
 $KCr(SO_4)_2$

cubic lattice of $NaCl$

Metallic Crystals

various forms of iron [9]

Valence electrons dissociate from individual atoms and form an **electron lake** (conduction band)

- electrical conductivity
- thermal conductivity (copper)
- shiny surface
- plasticity

Covalent bond

- Two atoms share an electron to reach noble gas configuration.
- Examples: zeolites, MOFs, diamond, quartz
- \Rightarrow high stability
- The entire crystal is a single molecule

Feldspar Albite $NaAlSi_3O_8$ [10]

Albite crystals [11]

van-der-Waals interaction

- typical for organic and macromolecular compounds
- stochastic charge distribution (dipole moments) causes mutual attraction between molecules
- weak (“soft”) interaction

protein crystals in mother liquor

Crystals in Crystallography

Definition *International Union of Crystallography*:

“A material is a crystal if it has essentially a sharp diffraction pattern.”

Crystal in the context of this lecture:

A crystal is composed of a chemical compounds that repeats periodically in all three directions.

Crystals in Crystallography

- The periodicity results in the diffraction pattern of the crystal
- The periodicity acts like a signal amplifier
- The smallest unit of the periodicity is an inclined box. It is called the **unit cell of the crystal**.

Crystal Growth

Crystals are

1. solid state materials
2. highly ordered, *i.e.* their entropy is very low compared to amorphous material

Especially for large molecules: weak interaction, *i.e.* low energy gain through crystallisation \Rightarrow Crystal growth can be difficult

Crystal Growth

Organic compounds: Precipitation from solution

Some means for precipitation (*cf.* LeChatelier's principle)

- Changes in temperature or pressure
 - sugar: better soluble in warm water
- precipitant
 - sugar: ethanol
 - high salt concentrations

Metals, alloys, and salts are often crystallised from melt. See e.g. Leibniz-Institut für Kristallzüchtung, <https://www.ikz-berlin.de>

Preliminaries for structure determination

need for crystals (instead of amorphous precipitation)

need for single crystals

Examples for Crystallisation e.g. [3]

1. Dissolve in Tetrahydrofuran (THF) in glass vial
2. Cover with parafilm: slow evaporation of THF
3. Store at -80°C

1. Dissolve in organic solvent (EtOH, Isopropanol, ...)
2. Store sealed on water reservoir
3. Uptake of water (vapour) reduces solubility of compound

Twinned structures (cf. end of term) can often be improved with elevated temperature during crystal growth ($30-40^{\circ}\text{C}$).

Crystallisation with vapour diffusion

Well with mother liquor (ML) with precipitant

Mix ML with compound solution
($V_{\text{drop}}=1 \mu\text{l}+1 \mu\text{l}$)

Seal well ($V_{\text{drop}}=2 \mu\text{l}$)

After equilibration: $V_{\text{drop}}=1 \mu\text{l}$

Crystallisation with vapour diffusion

1. Compound dissolved in 100 % isopropanol, concentration c
2. Mother liquor: 90 % isopropanol, 10 % water

Setup procedure

| | Volume | H_2O | i -PrOH | conc ⁿ | soluble? |
|---------------|-----------|--------|-----------|-------------------|----------|
| before | 1 μ l | 0 % | 100 % | c | yes |
| mixing | 2 μ l | 5 % | 95 % | $c/2$ | yes |
| equilibration | 1 μ l | 10 % | 90 % | c | no |

Remarks

- composition of mother liquor fine tunes end state
- insoluble compound precipitates
- slow diffusion enhances crystallization

5 X-rays and Diffraction

X-rays as electromagnetic radiation

X-rays are one type electromagnetic radiation — like visible light, UV-radiation, or radio waves

- Energy E and wavelength λ are equivalent ($E = h\frac{c}{\lambda} = 12.4 \text{ keV}\text{\AA}/\lambda$):
- Long wavelength $\lambda \leftrightarrow$ low energy E .
- Short wavelength $\lambda \leftrightarrow$ high Energie E .

X-rays as electromagnetic radiation

- Typical wavelength range for structure determination: 0.5-2 Å (24.8 - 6.2 keV).
- Inhouse X-ray instruments:

CuK_{α} : 1.54 Å \leftrightarrow 8.0 keV

MoK_{α} : 0.71 Å \leftrightarrow 17.3 keV

AgK_{α} : 0.56 Å \leftrightarrow 22.1 keV

WK_{α} : 0.21 Å \leftrightarrow 59.3 keV (medical applications)

- 1 Å = 10^{-10} m = 100 pm

Generation of X-rays

1. **X-ray fluorescence** (mainly laboratory sources) electron beam at specific energy hits metal surface (Cu or Mo). This creates
 - a) Bremsstrahlung (background)
 - b) X-ray fluorescence

Examples: rotating anode, liquid jet anode

2. **Synchrotron radiation** Acceleration of electron bunches in a magnetic field

Why X-rays?

Atom distances of molecules about 1–2 Å: required resolution d

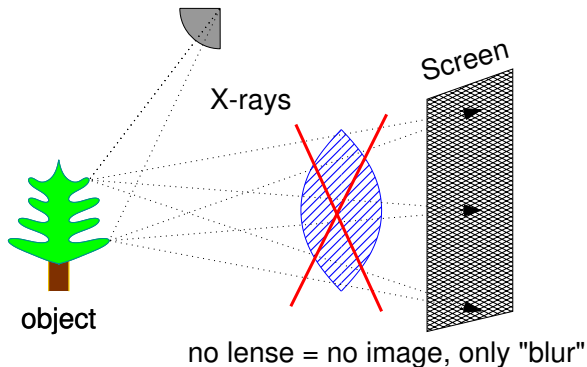

Optical instruments are limited in resolution to $d > \lambda/2$ (later: derivation *via* Bragg's law)

Optics and Imaging (Microscope / Telescope)

Objects scatter light. In order to see the object, the scattered light must be focused by **at least** one lens

X-ray Scattering

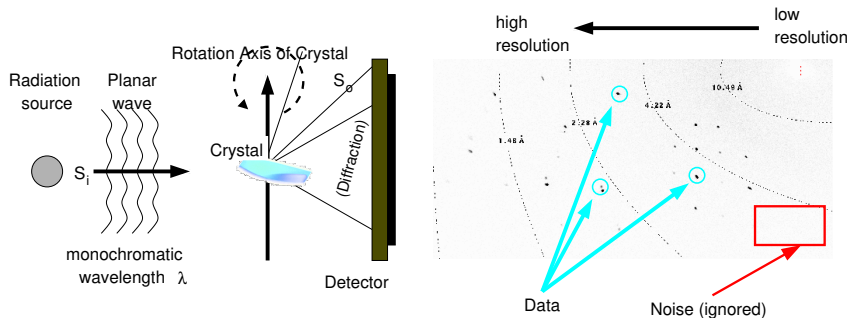

X-ray lenses do not exist: It is not possible to create a direct image of an object with X-rays.

X-ray Scattering by Crystals: Diffraction

The periodicity of the crystal results in a focussing of the scattered X-rays into **discrete spots**. The spots (reflections) can be measured without lenses. The crystal acts like a signal amplifier.

The X-ray Diffraction Experiment

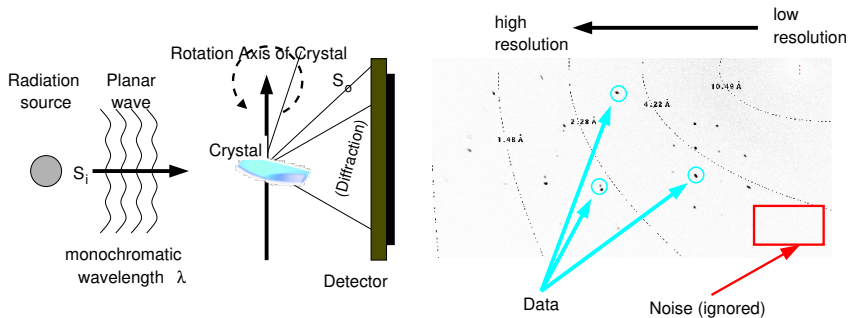

The crystal diffracts X-rays. This creates a **diffraction pattern** recorded by the detector.

The reflection spots are not images of the atoms

Typical laboratory X-ray Diffractometer

Data collection experiment

Reflections are data point. Each one contains different information. In order to collect as many data points as possible:

1. Rotation of the crystal (about one of three different axes, called ϕ -, ω -, and χ -circles)).
2. Rotation of the detector around the crystal, called 2θ -circle. This is parallel to the ω -circle).

The Data Set

The reflections can be described as three dimensional **reciprocal lattice**. The two dimensional detector records an intersection of the three dimensional lattice.

The full experiment results in a **data set**.

One data set consists of several runs (1–20). One run is the rotation of the crystal about a single axis. Per run, 180–2,000 **frames** are recorded. One frame corresponds typically to $0.1^\circ - 0.5^\circ$ rotation of the crystal.

courtesy Olivera Cvetkovic (AK Hultsch)

Examples of Data Frames

- Small molecule, unit cell dimensions:
 $a = 10.56\text{Å}$, $b = 11.64\text{Å}$, $c = 16.14\text{Å}$, $\alpha = \beta = \gamma = 90^\circ$
- Small unit cell: \Rightarrow few reflections
- Reflections beyond edge of detector:
 $\rightarrow 2\theta$ offset of detector necessary
- black reflections = data; grey regions: noise

Examples of Data Frames

- Macromolecule. unit cell dimensions: $a = 92.6\text{\AA}$, $b = 92.6\text{\AA}$, $c = 128.9\text{\AA}$, $\alpha = \beta = 90^\circ$, $\gamma = 120^\circ$
- Many more reflections
- Reflexes form patterns (lunes, “Kugeldreiecke”)
- Intensity reduces towards edge of detector

Examples of Data Frames

- Macromolecule. unit cell dimensions: $a = 111.7\text{\AA}$, $b = 80.5\text{\AA}$, $c = 70.3\text{\AA}$, $\alpha = \gamma = 90^\circ$, $\beta = 94.2^\circ$
- smeared reflexes
- ice rings (formed during measurement, or due to poor shock-freezing conditions)
- Closer look: small spots between “patterns”: twinned crystal, not a single crystal.

6 Objectives of a Crystal Structure

Why Crystal Structure Determination?

The Structure provides atom coordinates: arrangement of elements in 3D space

Organic Chemistry:

- Success (or failure) of synthesis
- Determination of absolute structure
- Polymorphism: different crystal packing of the same compound

Inorganic Chemistry:

- Bonding geometry, coordination geometry (of metals ...)
- Polymorphism: different crystal packing of the same compound
- Space group determination: space group symmetry relates to electro-optical properties (thermal expansion, piezo-material, ...)

Comparison with other Structural Methods

NMR : chemical environment, sum formula. Not absolute structure

Rotational spectroscopy: (and gas phase electron diffraction): bond distances (**much more precise** than crystal structure)

Crystallography : Virtually no size limit (protein complexes > 1.5 MDa; differentiation of element types)

Examples: Absolute structure and degree of purity

<http://en.wikipedia.org/wiki/Methylphenidate>

Ariëns [12] and Kumar, Hassan and Pahuja [13]

The crystal structure is the only method to determine the absolute structure and the degree of purity of mixtures.

- Methylphenidate (*alias* Ritalin): medication to treat Attention Deficit Hyperactivity Disorder (ADHD).
- Two chiral centres, *four* stereoisomers
- Typical: only one stereoisomer with desired effect.
- Remaining stereoisomers: side effects

Structure based Drug Development

The antibiotic *Thiostrepton* together with its target DNA. Dr. K. Pröpper.

Knowledge of structure of ligand and target:

- Improvement of chemical interaction
- Improvement of shape / surface: Functionality and access to cell or nucleus.
- Uptake in body (cf. <http://de.wikipedia.org/wiki/Insulinpräparat>)

7 Crystal Diffraction: Why do crystals produce reflections?

Independent Atom Model (IAM)

Crystal structure determination is based on the **independent atom model (IAM)**:

- the molecule consists of spherical atoms

Independent Atom Model (IAM)

Crystal structure determination is based on the **independent atom model (IAM)**:

- the molecule consists of spherical atoms
- upon irradiation, each atom re-emits a small spherical wave independently from the others
- the strength depends on the atom type

Independent Atom Model (IAM)

Crystal structure determination is based on the **independent atom model (IAM)**:

- the molecule consists of spherical atoms
- upon irradiation, each atom re-emits a small spherical wave independently from the others
- the strength depends on the atom type
- the detector records the overlap of all (tiny) waves

Independent Atom Model (IAM)

- every atom emits a tiny signal
- individual molecules are too weak to detect
- the crystal **amplifies** the signal

To understand, we introduce the **unit cell** and the **crystal lattice**.

The Unit Cell

“Periodicity of the
unit cell”?

The Unit Cell

“Periodicity of the unit cell”?

The Unit Cell

“Periodicity of the unit cell”?

The Unit Cell

“Periodicity of the unit cell”?

The Unit Cell

“Periodicity of the unit cell”?

The Unit Cell

“Periodicity of the unit cell”?

The Unit Cell

“Periodicity of the unit cell”:
Regular repetition
of the molecule

The Unit Cell

Periodicity of the unit cell:

Connect two equivalent atoms in two equivalent molecules

The Unit Cell

Periodicity of the unit cell:
connect two equivalent atoms in two equivalent molecules

Connect two equivalent atoms in two equivalent molecules

- connection can be shifted throughout the crystal

The Unit Cell

Periodicity of the unit cell:

Connect two equivalent atoms in two equivalent molecules

- connection can be shifted throughout the crystal
- can be any atom

The Unit Cell

This results in the **crystal lattice**. The smallest parallelepiped (smallest box) forms the **unit cell** of the crystal.

The Unit Cell

A three-dimensional box requires six parameters:

- unit cell constants a, b, c (edge lengths)
- angles between the edges

$$\alpha = \angle(b, c) \qquad \beta = \angle(c, a) \qquad \gamma = \angle(a, b)$$

- constants and angles are independent from the orientation of the crystal
- when written as vectors $\vec{a}, \vec{b}, \vec{c}$, they also describe the orientation of the crystal with respect to the instrument.

The convention **a: red**, **b: green**, **c: blue** comes from computer graphics, where colours are described as *rgb*.

Fractional Coordinates

Atom coordinates are often described with *fractional coordinates*.

Every position in the crystal has unique coordinates (x, y, z)

$$x * \vec{a} + y * \vec{b} + z * \vec{c}$$

(x, y, z) are called the **fractional coordinates** of this position.

For any position *inside* the unit cell:

$$0 \leq x, y, z \leq 1.$$

The position $(0.3, 0.6, 0.5)$.

Fractional Coordinates

Atom coordinates are often described with *fractional coordinates*.

Every position in the crystal has unique coordinates (x, y, z)

$$x * \vec{a} + y * \vec{b} + z * \vec{c}$$

(x, y, z) are called the **fractional coordinates** of this position.

For any position *inside* the unit cell:

$$0 \leq x, y, z \leq 1.$$

Fraction coordinates facilitate the use of symmetry operators. They are normally used in crystallographic computing.

- SHELXL ins-files always use fractional coordinates.
- Macromolecular PDB-files use orthogonal coordinates.

Example: ins-file for Oxalic Acid

```

```

Summary: The Unit Cell

The crystal structure is described by

1. the unit cell parameters $a, b, c, \alpha, \beta, \gamma$
2. positions and element types of the atoms inside the unit cell

The whole crystal is the result of integer translations (= shifts without gaps or overlaps) of the unit cell in all three directions.
